#### Deep Imbalanced Regression

Yang Y, Zha K, Chen Y, Wang H, Katabi D

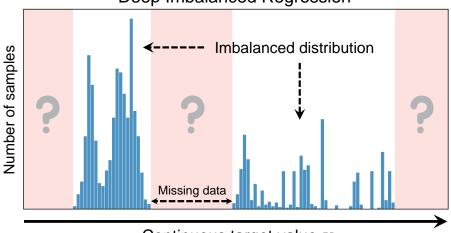

**ICML 2021** 

Presenter: Gianmarco Midena

26 November 2024

#### Overview

Continuous target value y

## **Problem Settings**

- $\{(\mathbf{x}_i,y_i)\}_{i=1}^N$ : training set
- $\mathbf{x}_i \in \mathbb{R}^d$ : input
- $y_i \in \mathcal{Y}$ : continuous label or target
- $b_i \in \mathcal{B}$ : discrete label or target
- $\mathcal{Y} \subset \mathbb{R}$ : continuous label space
- $\mathfrak{B} = \{1, \dots, M\} \subset \mathbb{Z}^+$ : index space
  - lacktriangle divides  ${\mathcal Y}$  into M groups (bins) with equal intervals  $[t_j,t_{j+1})$
  - $\{[t_0, t_1), \ldots, [t_{M-1}, t_M)\}$ : discrete label space
  - $t_k \in \mathcal{Y}$
  - minimum resolution
    - ★ e.g.,  $\delta y \triangleq t_{j+1} t_j = 1$  in age estimation
- $\hat{y}_i = g(\mathbf{z}_i) \in \mathbb{R}$ : predicted continuous label
- $\mathbf{z}_i = f(\mathbf{x}_i; \theta) \in \mathbb{R}^{d'}$ : learned representation
- $\theta$ : trainable model parameters

#### **Evaluation**

- Divide target space into disjoint regions (bins)
  - ► *Many-shot*: > 100 training examples
  - ▶ *Medium-shot*: 20-100 training examples
  - ► Few-shot: < 20 training examples
  - ► Zero-shot: 0 training examples
  - Inspired by Liu et al. 2019

#### Metrics

- Mean Absolute Error (MAE)
- Mean Squared Error (MSE)
- Pearson Correlation (PCC)
- ► Geometric Mean Error (GM)

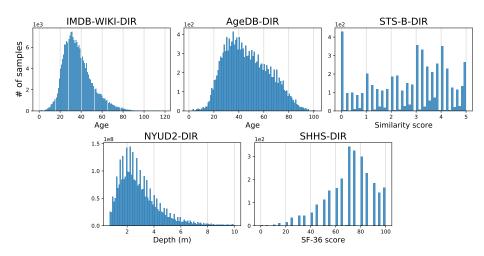

$$GM = \sqrt[n]{\prod_{i=1}^{n} |y_i - \hat{y}_i|}$$

★ Pros: + fairness (uniformity) in prediction

#### Datasets - Overview

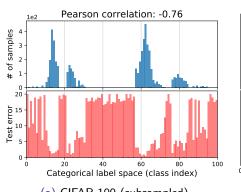

Dataset	Target type	Target range	Bin size	Max bin density	Min bin density	# Training set	# Val. set	# Test set
IMDB-WIKI-DIR	Age	0 - 186	1	7,149	1	191,509	11,022	11,022
AgeDB-DIR	Age	0 - 101	1	353	1	12,208	2,140	2,140
STS-B-DIR	Text similarity score	0 - 5	0.1	428	1	5,249	1,000	1,000
NYUD2-DIR	Depth	0.7 - 10	0.1	$1.46 \times 10^{8}$	$1.13 \times 10^{6}$	50,688 (3.51 × 10 <sup>9</sup> )	-	654 (8.70 × 10 <sup>5</sup> )
SHHS-DIR	Health condition score	0 - 100	1	275	0	1,892	369	369

### (Training) Datasets - Label Distributions

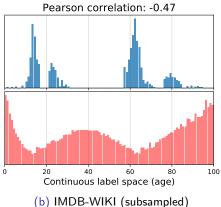

Label Distribution Smoothing (LDS)

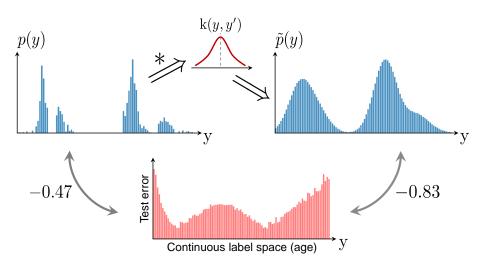

#### Test Error on Categorical vs. Continuous Label Space

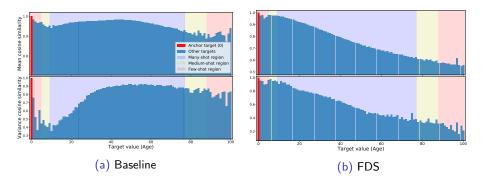

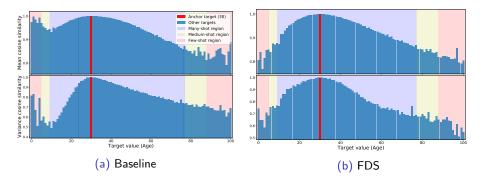

### The LDS Algorithm

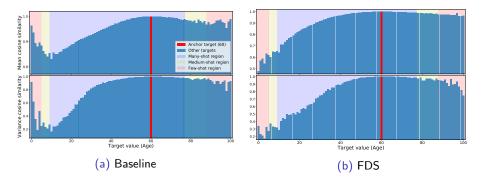

Feature Distribution Smoothing (FDS)

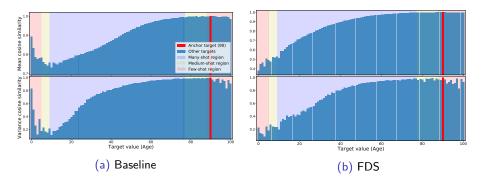

- FDS improves feature statistics calibration:
  - High similarity only in neighbourhood
  - ▶ Gradually decreasing similarity as the target becomes smaller or larger

- FDS improves feature statistics calibration:
  - High similarity only in neighbourhood
  - ▶ Gradually decreasing similarity as the target becomes smaller or larger

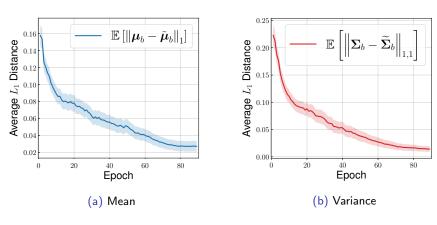

- FDS improves feature statistics calibration:
  - High similarity only in neighbourhood
  - ▶ Gradually decreasing similarity as the target becomes smaller or larger

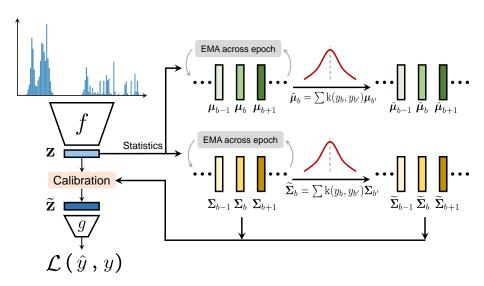

- FDS improves feature statistics calibration:
  - High similarity only in neighbourhood
  - ▶ Gradually decreasing similarity as the target becomes smaller or larger

## Change of feature statistics w.r.t. epoch

- ullet  $\mu, \Sigma$ : Running mean and variance
- $oldsymbol{ ilde{\mu}}, ilde{oldsymbol{\Sigma}}$ : Smoothed mean and variance

#### The FDS Algorithm

### Baselines (1/2)

- Vanilla: neglects data imbalance
- Synthetic samples
  - ► SMOTER (Torgo et al. 2013)
    - Defines frequent and rare regions using label density.
    - ② Creates synthetic samples for pre-defined rare regions by linearly interpolating both inputs and labels.
  - ▶ SMOGN (Branco et al. 2017): augments SMOTER with Gaussian noise
- Focal-R

$$\frac{1}{n} \sum_{i=1}^{n} \sigma(|\beta e_i|)^{\gamma} e_i$$

- Error-aware loss
- ▶ Maps the absolute error into [0, 1].
- $e_i$ :  $L_1$  error for the *i*-th sample
- $\triangleright$   $\beta$ ,  $\gamma$ : hyper-parameters
- Inspired by Focal Loss (Lin 2017) for classification

# Baselines (2/2)

- Regressor re-training (RRT)
  - Two-stage training
    - Train encoder
    - Re-train regressor with inverse re-weighting and frozen encoder.
  - ▶ Inspired by Kang et al. 2019
- Cost-sensitive re-weighting: re-weighting schemes based on label distribution
  - Inverse-frequency weighting (INV)
  - Square-root weighting variant (SQINV)

#### Results (1/2)

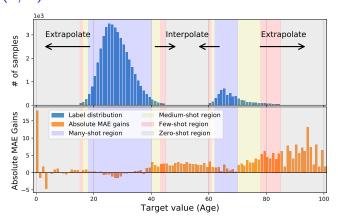

Figure: MAE gains of LDS + FDS over the vanilla model, on a curated subset of IMDB-WIKI-DIR.

Performance gains esp. for extrapolation & interpolation

# Results (2/2)

Metrics		MA	E↓			GM ↓			
Shot	All	w/ data	Interp.	Extrap.	All	w/ data	Interp.	Extrap.	
Vanilla	11.72	9.32	16.13	18.19	7.44	5.33	14.41	16.74	
Vanilla + LDS	10.54	8.31	14.14	17.38	6.50	4.67	12.13	15.36	
Vanilla + FDS	11.40	8.97	15.83	18.01	7.18	5.12	14.02	16.48	
Vanilla + LDS + FDS	10.27	8.11	13.71	17.02	6.33	4.55	11.71	15.13	
Ours (best) VS. VANILLA $+1.45 +1.21 +2.42 +1.17 +1.11 +0.78 +2.70 +1.61$									

Table: Interpolation & extrapolation results on a curated subset of IMDB-WIKI-DIR.

• Best results by smoothing both label & feature distributions
